#### 1. Introduction

The Japan Meteorological Agency (JMA) plans to begin the operation of its Himawari-8 satellite in 2015 and backup-operation by its Himawari-9 satellite in 2017, with both units scheduled to continue observation until around 2029. The information derived from the satellites will be processed to create Himawari Standard Data in Himawari Standard Format as master data for all products related to information from Himawari-8 and -9. Himawari Standard Data will be provided for each observation (see Section 2) and each band (see Table 1).

Note: In the event of a Himawari-8 failure before Himawari-9 enters stand-by orbit, Himawari Standard Data will be provided using information from Himawari-7 (MTSAT-2) (see Section 6).

| Band number | Central wavelength [µm]<br>(nominal values) | Valid number of bits per pixel |
|-------------|---|--------------------------------|
| 1           | 0.46  | 11                             |
| 2           | 0.51  | 11                             |
| 3           | 0.64  | 11                             |

Table 1 Himawari-8 and -9 observation bands

#### 2. Observation Areas

Himawari-8 and -9 will each carry an Advanced Himawari Imager (AHI) scanning five areas: Full Disk (images of the whole Earth as seen from the satellite), the Japan Area (Regions 1 and 2), the Target Area (Region 3) and two Landmark Areas (Regions 4 and 5). While the scan ranges for Full Disk and the Japan Area will be preliminarily fixed, those of the Target Area and Landmark Areas will be flexible to enable prompt reaction to meteorological conditions. At the beginning of Himawari-8's operation, Landmark Area data will be used only for navigation, and are not intended for use as satellite products. In the future, JMA plans to use Region 5 for observation of phenomena such as rapidly developing cumulonimbus clouds and to provide the resulting data to users. In each 10-minute period, the AHI will scan the Full Disk once, the Japan Area and Target Area four times, and the two Landmark Areas twenty times. These 10-minute divisions are basic units of an observation schedule called a timeline. In Himawari-8 and -9's baseline observation, the timeline will be repeated every 10 minutes except in their housekeeping operation.

The observation areas and frequencies are shown in Table 2, and scan images on a timeline are shown in Figure 1. The observation areas and numbers of pixels are shown in Table 3 (pixel numbers for regional observations may be changed in orbit testing after launch).

| Observation area      |                  | Observations per | Time cycle | Observations per<br>day |  |
|-----------------------|------------------|------------------|------------|-------------------------|--|
| Observation are       | Observation area |                  | [min.]     |                         |  |
| Full Disk             | Fixed            | 1                | 10         | 144                     |  |

#### 3. Map Projection Method

For Himawari Standard Data, Normalized Geostationary Projection is adopted as defined in LRIT/HRIT Global Specification<sup>2</sup> Section 4.4. The projection describes the view from the satellite to an idealized earth.

The parameters of the geographic coordinate system used for Himawari Standard Data are based on WGS84 (World Geodetic System 1984)<sup>3</sup> as recommended in ETSAT6/Doc. 16 (1) Implications of Using the World Geodetic System 1984 (WGS84)<sup>4</sup>.

#### 4. File Naming Convention

In the naming convention for Himawari Standard Data, capitals in file names indicate unique letters, and italics depend on the observation time, band numbers and other parameters. The meanings of italics are shown in Table 4, where the time zone is UTC (Coordinated Universal Time).

Note: Observation data may be divided into segment files as needed (see Table 4 kkll).

The general file name format is:

HS\_aaa\_yyyymmdd\_hhnn\_Bbb\_cccc\_Rjj\_Skkll.DAT

| Character | alics in the file name general format                             |
|-----------|---|
|           | Description   |
| aaa       | Satellite name  |
|           | H08: Himawari-8   |
|           | H09: Himawari-9   |
|           | H07: Himawari-7 (MTSAT-2)   |
| уууу      | Observation start time (timeline) [year] (4 digits)               |

- The term "radiance" refers to spectral radiance.

- The term "backup operation" refers to periods of backup by Himawari-7 (MTSAT-2).

<sup>8</sup> Correction follows the following procedure:

- (1) All pixels are rotated
- (2) All pixels in the line indicated by the No. 7 line number after rotation are replaced.

This line number is a discrete value.

For the middle line, the translation interpolation value is used.

#### 6. Backup Operation by Himawari-7 (MTSAT-2)

In the event of Himawari-8 failure before Himawari-9 starts operation as a second satellite, JMA will disseminate Himawari-7 (MTSAT-2) observation data as backup. In such cases, only full-disk or half-disk (Northern or Southern Hemisphere) observations will be made every 15 or 30 minutes, and no regional observations will be made. There will be five bands (one visible and four infrared) and a total of 56 images per day.
