Recent progresses of
the Global Satellite Mapping of Precipitation (GSMaP) Products

Takuji Kubota, Moeka Yamaji, Munehisa K. Yamamoto, Hitoshi Hirose

Japan Aerospace Exploration Agency
(JAXA)

The Global Satellite Mapping for Precipitation (GSMaP) produces high-resolution and high frequent global precipitation map based on multi-satellite passive microwave radiometer observations with information from the Geostationary InfraRed (IR) instruments (Kubota et al. 2020). Output product of GSMaP algorithm is 0.1-degree grid for horizontal resolution and 1-hour for temporal resolution. The GSMaP near-real-time version product (GSMaP_NRT) has been in operation at JAXA since November 2007 in near-real-time basis and browse images and binary data available at JAXA GSMaP web site (http://sharaku.eorc.jaxa.jp/GSMaP/).

This presentation shows recent progresses such as a new version of the GSMaP products released in December 2021. We plan the reprocessing of the GSMaP standard version in a period during the past 24 years since Jan. 1998. The GSMaP real-time version (GSMaP_NOW) with the new algorithm was also released in December 2021. Accuracy improvements of the GSMaP products were confirmed by validations with the gauge-adjustment ground radar data over the Japan.
